

MainTegrity and Gartner Q2/2025

This past quarter we had two informative and productive Gartner analyst briefings. We updated one analyst in Gartner's software engineering practice and another analyst in their public cloud infrastructure practice. Both analysts have extensive information security experience and great familiarity with IBM z/OS.

MainTegrity CEO Al Saurette provided a brief product overview and then shared a use case of how MainTegrity Cybersecurity Framework or CSF would have remediated a recent breach at a large healthcare provider. This particular breach impacted nearly 200 million individuals in the healthcare organization's system, with remediation costs currently at more than \$2 billion and rising.

Both Gartner analysts were very interested in an upcoming new release of MainTegrity CSF 3.2 (you can read about this [release here](#)). They both had significant interest in data exfiltration defenses and CSF ability to provide immediate damage control.

It was a productive meeting for all parties involved. Gartner asked MainTegrity to keep them informed periodically about additional new releases and future solution development items to improve cyber defense. If your organization is a Gartner research client you should reach out to them and hear what they have to say about MainTegrity CSF.
